

We have prepared a practical task for you to complete.

The task is as follows:

1. Write a script with node.js and with MongoDB database
2. Write a script to create a user, update user, delete user, get the all users and make mock login with user route in node js .
3. All the script should print the retrieved to the console.

To complete this task, you will need to have a working Node.js development environment and access to a MongoDB server.

Once you have completed the task, please submit your code for review by your supervisor.

Good luck and happy coding!
